Robert Hummer is a social demographer whose research centers on health and mortality disparities by race/ethnicity, gender, and socioeconomic status in the United States. He has published more than 90 journal articles, book chapters, and books related to U.S. health and mortality patterns, most of which focus on racial/ethnic, gender, and socioeconomic disparities. He is particularly experienced with developing conceptual models for the understanding of racial and ethnic patterns and trends of health/mortality, as well as with the effective use of very large data sets to study U.S. health and mortality patterns and trends. His most recently completed NIH-funded project focused on the relationship between educational attainment and adult mortality in the United States. He is currently working on a MacArthur Foundation funded project that focuses on the accurate documentation and understanding of older adult health and mortality patterns among the minority and immigrant subpopulations of the United States.
